

Why EsecureData

Over the last sixteen (16) years EsecureData's (Esecure) colocation services have evolved to offer advanced capabilities well beyond the colocation standard of power and space for hardware and increasingly provides IT organizations the flexibility to easily scale infrastructure and keep up with the demands of a growing business over time. Esecure has made significant investments into the expansion of power density, hybridization, efficiency, security and compliance that allow our datacentre to exceed any legacy datacentre and provide a truly scalable, future-proof footprint for our customers.

Expertise and Infrastructure

The Esecure datacentre located near downtown Vancouver, BC is the largest neutral colocation centres in Coquitlam and was designed and built by industry experts and operated by a team of seasoned professionals. Our on-site personnel have worked at some of the top datacentres in Canada and have been responsible for building a North American backbone as well as multiple other datacentres. Esecure DC3, our new datacentre located in Coquitlam, is built using the same approach and the same standards. We have in-depth knowledge of client issues and priorities, along with the vast expertise and diverse technical skills you're looking for.

Our facilities were designed and are operated according to industry-best practices, including SSAE 16 Type II audits and ISO 27002. We've designed the facilities with an ambitious goal in mind: become the industry leader for high-performance colocation that addresses the challenges and diverse requirements for businesses of all of sizes. This includes rendering farms, high density cloud environments, mission critical workloads, multi-site disaster recovery and other projects that may arise when a company embark on major technological projects.

At Esecure, companies have access to enterprise-ready services without having to outlay any significant capital and resources to build and operate their own datacentre, saving as much as 50% on their costs. Our clients value our 24/7 support and flexible solutions that continue to build our reputation into what it is today.

High Performance Connectivity

As a neutral colocation centre operator, Esecure is a totally independent operator with many top Canadian companies and providers using our services today. Esecure has access to multiple top-tier Internet Service Providers and telecommunications operators. This means that companies can benefit from a greater choice of competing services, Internet service providers, Internet access points, and content distribution networks (CDN). This solution guarantees that you'll enjoy the highest performance connectivity, service, and price.

At Esecure, we also understand that the speed at which data is transmitted is crucial for businesses, especially those transmitting data across geographies or distances where latency can impact their users or information. Esecure is strategically located to optimize telecommunications and to enable highly efficient communications. The Esecure DC3 allows latency under 2 ms to Vancouver and less than 50 ms to Toronto.

Security and Environment

In our industry, a high level of security is essential. We have created a controlled environment that is equipped with industry-leading biometric security, as well as a fully staffed network operations centre, sophisticated camera surveillance system that operate 24/7, 365 days a year. In our facilities, we utilize security zones that control incoming and outgoing visitor traffic and access to network equipment and server rooms are strictly controlled. We also keep the identities of our clients and their use of our facilities strictly confidential.

Esecure was designed with a continuous focus on reducing our impact on the environment. Besides using 100% hydro power and being a member of the Green Business Bureau, we utilize an industry-leading datacentre infrastructure management system that helps us optimize our equipment and maximize energy efficient. Since 2014, Esecure has been a leader in air flow innovation using a proprietary system called A.R.I.E.S (air recycler inflow exhaust system) that reduces power consumption by as much as 35% while cooling high density infrastructure environments.

Service Levels

At the heart of Esecure's colocation offerings is our service level agreement (SLA). This is a summary of expectations that any business or customer should have as the SLA sets forth guidelines that determine responsibility, requirements, guarantees and helps you understand which areas of your infrastructure are Esecure's responsibility versus your responsibility. Esecure guarantees access to power and network 100% of the time and we have the industry's highest service levels for hardware, replacement, repairs, security and support. For any hardware related issue Esecure guarantees replacement in 60-minutes or less as well as guaranteed support response times of 5 minutes or less for business critical events and 60-minutes or less for non-business critical support requests.

Pricing Options

Over the past few years, datacentres have devised new ways to structure the pricing of their colocation services to better match the requirements of different categories of buyers. Esecure gives our customers transparency on their pricing with no hidden fees or add-on costs. Anybody who has purchased colocation from a legacy provider knows that getting clear and concise pricing can be an exercise in futility and Esecure's goal is to remove that and make sure that the price you signed up for is what you pay.
